Level-monitoring system

Our system

Our level-monitoring system provides you with an innovatively complete solution for level monitoring and display of your wet room. It consists of the following integrated components:

Level control

This robust box is the centerpiece of the system. It is intended for the connections of individual components and provides the central control-unit with the output signals "WC-out of order" and "Water empty". The control unit will then actuate the tank heating, the door control or simply the WC-signal light.

Probe sensor

This robust sensor measures water level in the water tank. Housing is made of high-grade stainless steel and PTFE to guarantee long-term trouble-free operations.

Digital sensors on waste tank

Two capacitive sensors signal the system whether the waste tank should be discharged or the WC must be closed down due to overfilled tank.

Level displays

These robust displays are based on decades of proven button-technology. They are mounted on both exterior sides of the vehicle and show service staff the status of the lavatory system by pressing the button. Waste-tank status is signaled by a red LED. Fresh-water tank level is displayed by 12 yellow LEDs.

WC-signal light

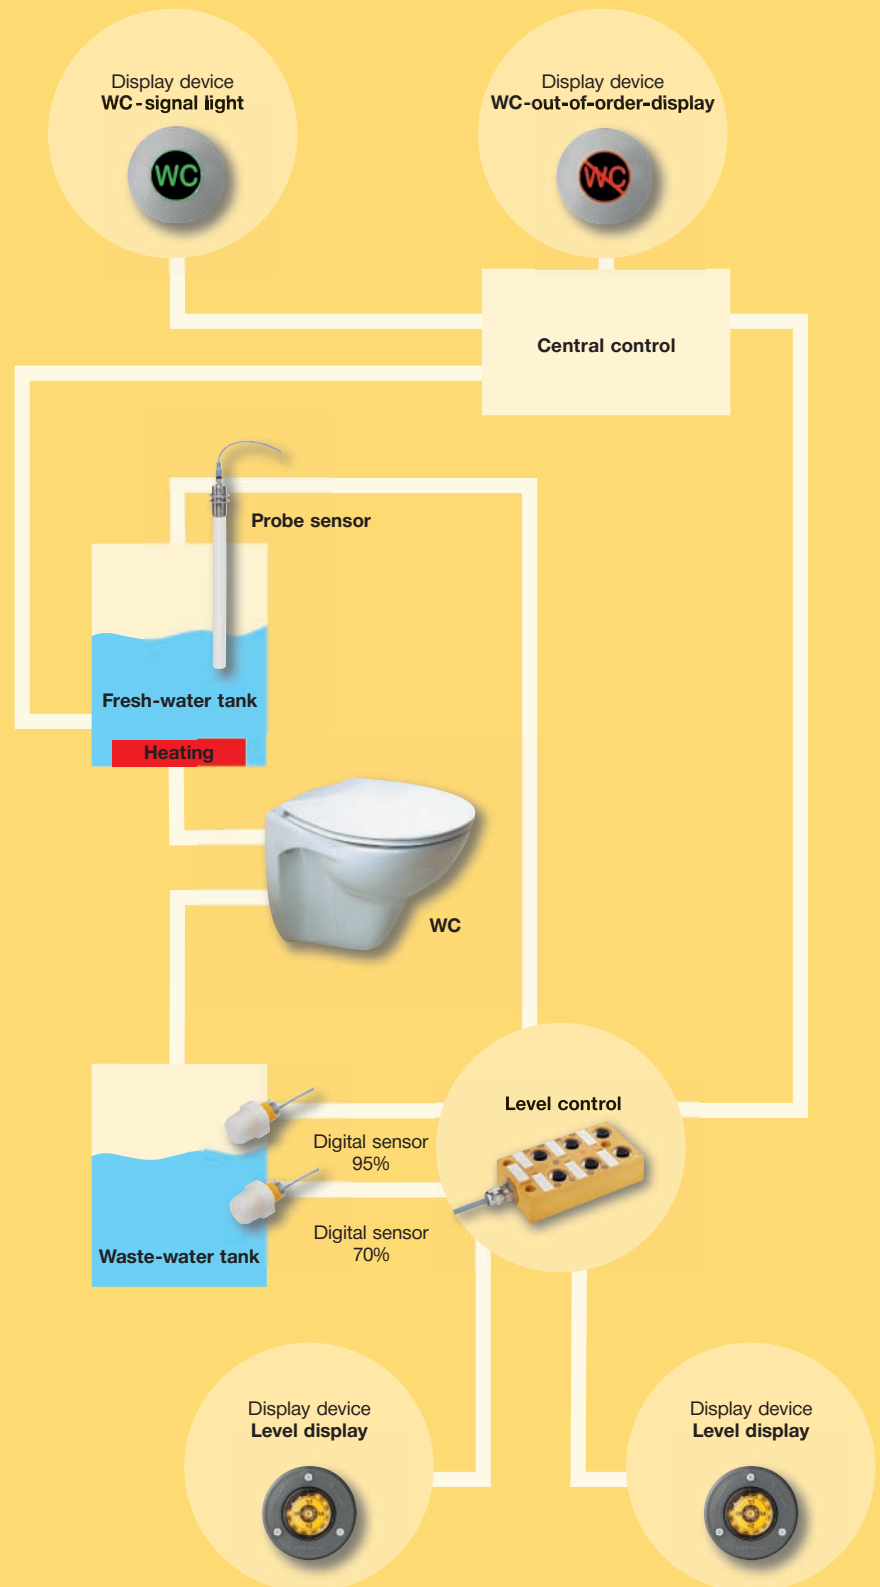

The WC-signal light can display three statuses "free", "occupied", and "out of order" by change in color and flashing display.

WC-out-of-order-display

The signal light can be used to signal a defective WC.

Your advantage

The easy and pluggable wiring of all components and diagnosis functions, minimize installation- and repair periods. This saves money and increases customer satisfaction.
