Solid-state relay
PK 9260.91/040

Solid-state contactor
PK 9260.91/040/03
with heat sink 15 A

Your Advantages

- Self-optimized impulse distribution with minimized cycle times
- Allows for precise temperature regulation
- Switching at zero crossing, providing outstanding EMC properties
- With heat sink for DIN-rail mounting
- Space saving, only 22.5 mm width

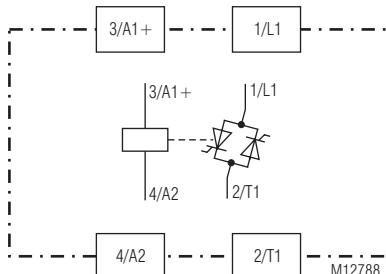

Features

- According to IEC/EN 60947-4-3
- AC solid-state relay / -contactor for pulse package control of heating systems
- DCB technology (direct bonding method) for excellent heat transmission properties
- Control input DC 4 ... 20 mA
- Nominal voltage AC 24 ... 240 and AC 48 ... 480 V
- Load current 10 A, 15 A, 20 A, 40 A, 50 A, 88 A AC 51
- LED status indicator for control and failure
- M4 flat terminal
- Degree of protection IP20

Product Description

The PK 9260 solid-state relay/contactor has an analogue control input DC 4 ... 20 mA with which the switch-on/switch-off ratio of the load current is controlled proportionally. The PK 9260 is available with pre-mounted heat sink (solid-state contactor) and without pre-mounted heat sink (solid-state relay).

Circuit Diagram

Approvals and Markings

Applications

The zero-voltage switching solid-state relay with its 4 ... 20 mA analogue input for pulse packet control is ideal for controlling heating elements and infrared lamps. It enables precise temperature control and offers a wide range of applications due to its fast and silent switching, e.g. for injection moulding machines in the plastics and rubber industry, for thermoforming and packing machines or also in the food industry.

Functions

The PK 9260/_4_ solid-state relay with two antiparallel-connected thyristors is designed as a zero-voltage switch. The output of the solid-state relay is always activated at zero crossing of the sinusoidal mains voltage. After the control signal is removed, the solid-state relay switches off again at the next zero crossing of the load current.

The on/off ratio of the output is set proportionally to the control current. The control current range of 4 to 20 mA is converted into an on/off ratio of 0 to 100 %. The LED indicates the unit status.

Indications

| | | |
|------------|--------------------|--|
| LED A1-A2: | Yellow | Operating voltage and control current available. The flashing cycle corresponds to the on/off switching ratio specified by the control current. |
| | Red-fast flashes | Control current < 4 mA |
| | Red-slowly flashes | Control current > 21 mA |

Control Circuit

| | |
|--------------------------|-----------------------------|
| Operating voltage A+1/A2 | Max. 35 V DC |
| Load voltage | Max. 8 V (< 400 Ω at 20 mA) |
| Current range | DC 4 ... 20 mA |
| Overcurrent protection | Limit to 35 mA |
| Trip | 5 % ± ½ cycle |

Output

| | | |
|---------------------------|------------|------------|
| Load voltage AC [V]: | 24 ... 240 | 48 ... 480 |
| Peak reverse voltage [V]: | 650 | 1200 |
| Frequency range [Hz]: | 47 ... 63 | |

Solid-state relays - Determine the heat sink

Choice according to table

The heat generated by the load current must be dissipated by a suitable heat sink. It is imperative that the junction temperature of the semiconductor is maintained for all potential environmental temperatures of under 125 °C. For this reason, it is important to keep the thermal resistance between the base plate of the solid-state relay and the heat sink to a minimum. To protect the solid-state relay effectively from excess heating, a thermally conducting paste or a graphite gasket (see Accessories) should be applied before installation to the base plate of the heat sink between semiconductor relay and heat sink.

From the table, select a suitable heat sink with the next lowest thermal resistance. Thus, it is ensured that the maximum junction temperature of 125 °C is not exceeded. The load current in relation to the environmental temperature can be seen from the table.

Solid-state contactor

Solid-state with optimised heat sink

We recommend the following combination of solid-state relay and heatsink depending on the load current and an ambient temperature of 40 °C.

If the solid-state relays are used at ambient temperature above 40 °C the load current has to be reduced according to the current reduction (A / °C see table).

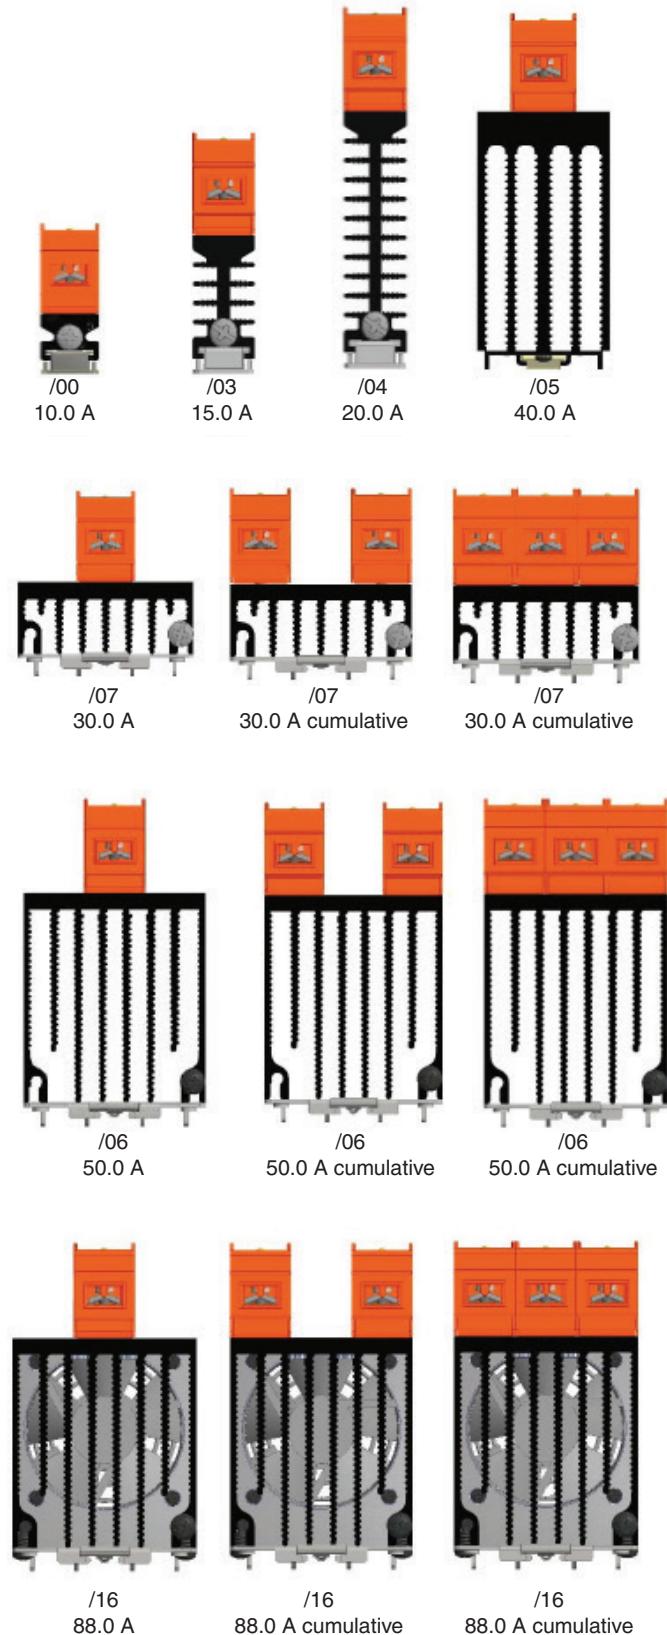

Example:

Operation at $T_U = 45$ °C; heat sink for 15 A with 0.3 A / °C

Current reduction: 5 °C \times 0.3 A / °C = 1.5 A

Max. load current: 15 A - 1.5 A = 13.5 A

Factory mounted heat sink

Operation Notes

EMC disturbance during operation has to be reduced by corresponding measures and filters. If several solid-state relays are mounted together sufficient cooling and ventilation has to be provided.

Safety Notes For Variants With Fan

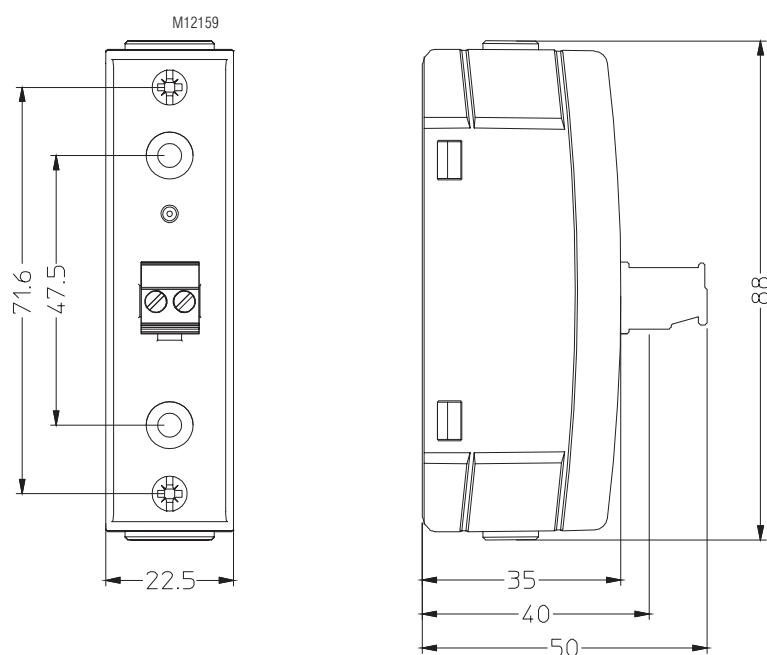

Risk of fire or other thermal hazards!

WARNING Danger to life, risk of serious injuries or property damage.

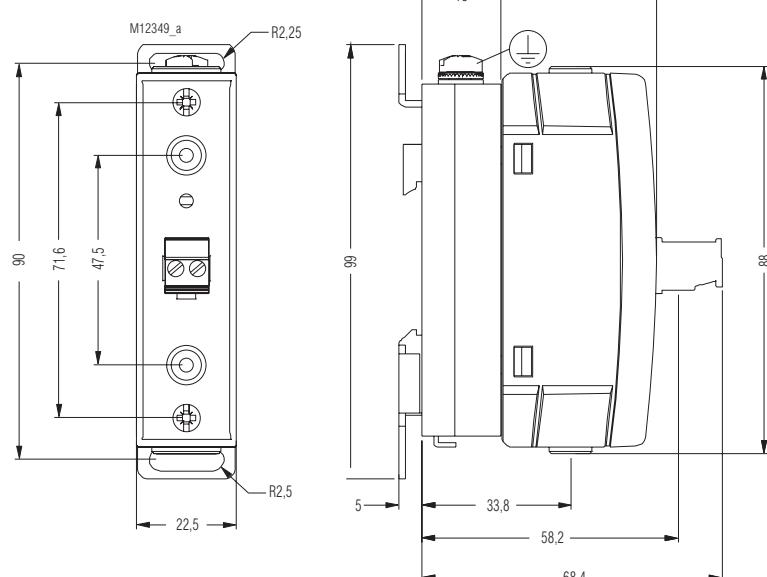

- The device has no overtemperature alarm. If the fan fails, the unit may overheat and become a fire hazard.
- The user must take precautions to detect a fan failure.
